Error: Unable to parse log file. The reason I think is that my disk is full and might not be able to store the process. A: I was able to fix the problem by following the answer from this question. du -sh /mnt/beagle/videos/*/*/*/*/*.avi Thanks to @SpoonHOG for suggesting this. Instead of du -sh /mnt/beagle/videos/*/*/*/*.avi it was easier to grep with the directory path. du -sh /mnt/beagle/videos/*/*/*/*.avi | grep -v "^/mnt/beagle/" In modern memory devices, the minimum feature size, commonly known as the critical dimension, required to form a feature in a die, such as a via in a die or a trench in the substrate, has dropped below the size of photoresist patterns. As a result, the photolithographic step and other processes typically used to

define patterns in the photoresist layer and to etch the underlying layer to form the pattern may not be suitable for defining such small features. Rather, alternative processes are necessary to form the desired features. A particularly promising technique for forming small features involves sidewall image transfer, or “SIT.” In an SIT process, a hard 82157476af
